This is the first book to directly address the physics of urban sustainability and how urban sustainability may be

modeled and optimized Starting with an introduction to the importance and key aspects of the topic it moves on to a detailed consideration of the urban climate and pedestrian comfort Comprehensive techniques for the modeling and optimisation of urban metabolism are then described together with means for defining sustainability as the fitness function There are many books that provide case studies of urban design projects that meet narrow sustainability objectives however there are few that provide a comprehensive assessment and none that provide tools to evaluate urban development projects This book is
