This book addresses a major problem for today's large scale networked systems certification of the required stability and performance properties using analytical and computational models. On the basis of illustrative case studies it demonstrates the applicability of theoretical methods to biological networks, vehicle fleets and Internet congestion control. Rather than tackle the network as a whole, an approach that severely limits the ability of existing methods. About the Author: Murat Arcaç is a professor at UC Berkeley in the Electrical Engineering and Computer Sciences Department. His research is in dynamical systems and control theory with applications to synthetic biology, multi-agent systems and transportation.
